

SAVE TO CHAIN

The Universal Blockchain Save Button

Core Feature Specification & Investment Overview

Bitcoin Corporation Ltd

Version 1.0 - November 24, 2025

EXECUTIVE SUMMARY

The "Save to Chain" feature represents the most fundamental innovation in digital work preservation since the invention of the save button itself. Every Bitcoin Application includes this standardized feature that automatically creates an immutable, chronological record of user work from career genesis to retirement - a complete professional legacy stored permanently on the Bitcoin blockchain.

WHAT IS SAVE TO CHAIN?

The Concept

Save to Chain transforms every save action into a permanent blockchain record. When users press "Save" in any Bitcoin Application, the system creates cryptographic hashes of their work and stores them in a Git-like Merkle tree structure on the Bitcoin SV blockchain. This creates an unbreakable chain of professional output that spans entire careers.

How It Works

Every save operation generates a cryptographic hash of the document or data. These hashes are linked together in chronological order, creating a complete audit trail of creative and professional work. The system can store hashes only (for privacy) or full documents (for transparency), depending on user preferences and application requirements.

Universal Implementation

This feature is designed to become the standard across ALL software applications with save functionality. From word processors to spreadsheets, from design tools to code editors, every application will eventually incorporate blockchain-based saving as the default method of preserving human work.

WHY THIS INNOVATION MATTERS

Professional Legacy Preservation

For the first time in human history, individuals can maintain a complete, tamper-proof record of their professional output. From the first document saved as a student to the final will and testament, every piece of work is preserved in chronological order with cryptographic proof of authenticity and timing.

Intellectual Property Protection

Automatic timestamping and hashing provide ironclad proof of creation dates and content authenticity. This eliminates disputes over intellectual property ownership and provides legal-grade evidence of creative work and innovation timing.

Career Documentation

Employers, clients, and collaborators can verify work history and professional development through blockchain records. This creates unprecedented transparency and accountability in professional relationships while maintaining privacy controls.

INVESTMENT VALUE PROPOSITION

Market Transformation Potential

Save to Chain has the potential to become as ubiquitous as the save button itself. Every software application that handles user-created content represents a potential licensing opportunity or implementation partner. The addressable market includes virtually every

productivity software company globally.

First Mover Advantage

Bitcoin Corporation Ltd is pioneering this fundamental shift in how digital work is preserved. Early investment positions stakeholders at the forefront of a technology that will become standard across the entire software industry within the next decade.

Implementation Simplicity

The core functionality is straightforward to implement and can be integrated into existing applications through simple API calls. This low barrier to adoption accelerates market penetration and reduces development costs for implementation partners.

TECHNICAL FOUNDATION

Built for Scale

The system leverages Bitcoin SV's massive transaction capacity and low fees to handle millions of save operations daily. Merkle tree structures ensure efficient storage while maintaining complete audit trails for billions of documents across millions of users.

Gateway to Advanced Features

Save to Chain serves as the foundation for numerous advanced features including work tokenization, career securitization, real-time data markets, and professional syndication. Each additional feature layer increases platform value and revenue potential exponentially.

TECHNICAL DESIGN SPECIFICATION

Architecture Overview

User Action	→	Hash Generation	→	Blockchain Storage	→	Merkle Tree Update
Press Save		SHA-256 Hash		BSV Transaction		Career Timeline
Document Edit		Content Hash		Timestamp Proof		Work History
File Creation		Metadata Hash		Immutable Record		Professional Legacy

Core Components

Component	Function	Implementation
Hash Generator	Creates SHA-256 hash of document content	Client-side JavaScript/native code
Blockchain Interface	Submits hash to BSV network	BSV API integration
Merkle Tree Manager	Maintains chronological work history	Local + blockchain storage
Privacy Controller	Manages hash vs. full document storage	User preference settings
Verification Engine	Proves document authenticity	Hash comparison algorithm
Timeline Viewer	Displays career work history	Web interface/mobile app

Implementation Requirements

- Bitcoin SV wallet integration for transaction creation
- SHA-256 hashing library for content fingerprinting
- Merkle tree data structure for efficient history management
- API endpoint for blockchain transaction submission
- Local storage for offline operation and performance
- User authentication and privacy preference management

Development Timeline

Phase	Duration	Deliverable
Phase 1: Core Infrastructure	4 weeks	Basic hash generation and blockchain storage
Phase 2: Merkle Tree Implementation	3 weeks	Chronological work history tracking
Phase 3: Privacy Controls	2 weeks	User preference management system
Phase 4: Verification Tools	3 weeks	Document authenticity verification
Phase 5: Integration APIs	2 weeks	Third-party application integration
Phase 6: Testing & Optimization	2 weeks	Performance tuning and security audit

IMPLEMENTATION CHALLENGES & SOLUTIONS

The Wallet Integration Challenge

For users to save to chain, they need Bitcoin wallet functionality integrated into their applications. This presents several challenges that Bitcoin Corporation Ltd is uniquely positioned to solve.

Problem: Third-Party Dependencies

Traditional applications like Microsoft Word cannot be modified to include native blockchain functionality. Users would need to make API calls to external services, creating dependencies on third parties for payment and transaction processing. This undermines the peer-to-peer nature of blockchain technology and creates potential points of failure.

Solution: Subscription-Based Transaction Processing

Bitcoin Corporation Ltd solves this by covering blockchain transaction costs through user subscriptions. For a small monthly fee, users can save unlimited documents to chain without worrying about individual transaction costs or wallet management. This approach scales efficiently while maintaining user simplicity.

Problem: Incumbent Software Limitations

Existing software applications cannot be retrofitted with Save to Chain functionality. Microsoft, Google, and other incumbent software providers have no incentive to integrate blockchain-based saving into their existing products, creating a fundamental adoption barrier.

Solution: Wholesale Application Rebuilding

Bitcoin Corporation Ltd is rebuilding essential productivity applications from the ground up with native blockchain functionality. Bitcoin Writer, Bitcoin Spreadsheets, Bitcoin Email, and other applications provide familiar functionality while offering superior blockchain-based features that incumbent software cannot match.

The Adoption Strategy

Multi-Dimensional Value Creation

To overcome adoption challenges, Bitcoin Applications must provide compelling value beyond just blockchain saving. Our applications incorporate tokenization, real-time collaboration, data monetization, and professional verification features that create immediate user value while establishing the Save to Chain standard.

Network Effects & Professional Benefits

As professionals build their blockchain work histories, the platform becomes more valuable for employers, clients, and collaborators seeking to verify credentials and work history. This creates strong network effects that accelerate adoption as early users gain competitive advantages in their professional markets.

INTELLECTUAL PROPERTY & OPEN SOURCE STRATEGY

Patent Portfolio Development

Bitcoin Corporation Ltd is pursuing strategic patents on key innovations including blockchain-based document versioning, career timeline creation, and subscription-based transaction processing. These patents protect core innovations while enabling licensing opportunities with major software providers.

Open Source Foundation

The basic Save to Chain functionality is open-sourced under MIT license to encourage adoption and community development. This strategy builds ecosystem support while maintaining proprietary control over advanced features and enterprise implementations that generate revenue.

Licensing & Partnership Strategy

Major software companies can license Save to Chain technology for integration into existing products. This provides revenue opportunities while accelerating market adoption through established user bases and distribution channels.

REVENUE MODEL & FINANCIAL PROJECTIONS

Subscription Tiers

Tier	Monthly Price	Save Operations	Target Market	Features
Basic	\$2.99	1,000 saves	Individual users	Document hashing, basic timeline
Professional	\$9.99	10,000 saves	Professionals	Full documents, career verification
Premium	\$29.99	Unlimited saves	Power users	Advanced analytics, export tools
Enterprise	\$99.99	Unlimited team	Organizations	Team management, compliance tools
Archival	\$4.99	500 saves	Long-term storage	Permanent preservation guarantee

Premium Save Operations

Different types of saves command premium pricing based on their complexity and importance:

- Legal Document Save: \$0.50 per save (notarization-grade timestamping)
- IP Creation Save: \$1.00 per save (patent-ready documentation)

- Contract Save: \$0.25 per save (multi-party verification)
- Certified Work Save: \$0.10 per save (professional credential building)
- Archive Save: \$0.05 per save (long-term preservation guarantee)

5-Year Financial Projections

Metric	Year 1	Year 2	Year 3	Year 4	Year 5
Subscribers	10K	50K	200K	500K	1M
Avg Revenue/User/Month	\$8.50	\$9.20	\$10.50	\$12.00	\$14.50
Monthly Recurring Revenue	\$85K	\$460K	\$2.1M	\$6M	\$14.5M
Annual Revenue	\$1M	\$5.5M	\$25.2M	\$72M	\$174M
Premium Save Revenue	\$50K	\$400K	\$2.5M	\$8M	\$20M
Total Annual Revenue	\$1.05M	\$5.9M	\$27.7M	\$80M	\$194M

IMPLEMENTATION ROADMAP & OUTCOMES

Phase 1: Foundation (Months 1-6)

- Complete core Save to Chain infrastructure development
- Launch Bitcoin Writer with basic save-to-chain functionality
- Establish subscription billing and user onboarding systems
- Target: 1,000 beta users, \$10K monthly recurring revenue

Phase 2: Expansion (Months 7-18)

- Launch Bitcoin Spreadsheets, Bitcoin Email, and Bitcoin Drive
- Implement premium save operations and tiered pricing
- Develop enterprise features and team management tools
- Target: 25,000 users, \$200K monthly recurring revenue

Phase 3: Integration (Months 19-36)

- Partner with major software companies for licensing deals
- Launch API for third-party application integration
- Implement advanced analytics and career verification tools
- Target: 200,000 users, \$2M monthly recurring revenue

Phase 4: Dominance (Years 4-5)

- Establish Save to Chain as industry standard
- Expand internationally with localized applications
- Develop enterprise compliance and regulatory tools
- Target: 1M+ users, \$15M+ monthly recurring revenue

Long-term Market Impact

By Year 5, Bitcoin Corporation Ltd projects that Save to Chain functionality will be standard across the productivity software industry. The company's first-mover advantage and patent portfolio position it to capture significant value from this fundamental shift in how digital work is preserved and verified.

Key Success Metrics

- 1 million active subscribers by Year 5
- \$194M annual recurring revenue from Save to Chain subscriptions
- 10+ major software companies licensing the technology
- 50+ enterprise clients with custom implementations
- Industry recognition as the standard for blockchain-based document preservation

Investment Summary

The Save to Chain feature represents a foundational technology that will transform how digital work is preserved, verified, and monetized. With clear revenue models, strong IP protection, and a comprehensive implementation roadmap, this innovation offers investors exposure to a technology that could become as ubiquitous as the save button itself.
